

ITI0209: User Interfaces

14. Visualizations Continued.

Martin Verrev

Spring 2023

Data are facts.

Information is the meaning that human being assigns to these facts.

Let's Recap:

Good graphs should **tell a story** and **be memorable**, but also have a **low information to ink ratio** and **not mislead** the viewer.

Choice of colour when designing charts and graphs is also important to allow for colour blindness and black and white printing.

Data Visualization Workflow: 1/6

Understand the context. Who? What? How?

Therefore, the first lesson is to understand the context and then embarking on your journey of utilizing the data as per the understood context.

Data Visualization

Workflow: 2/6

Choose an appropriate visual display

We covered it during the previous class :)

(Nussbaumer, p36)

Change in the Number of New Confirmed Cases

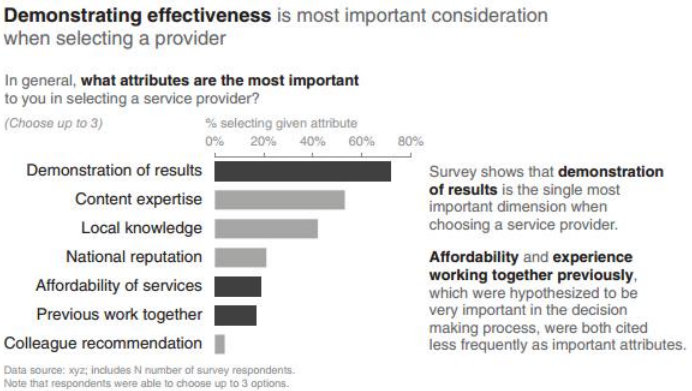

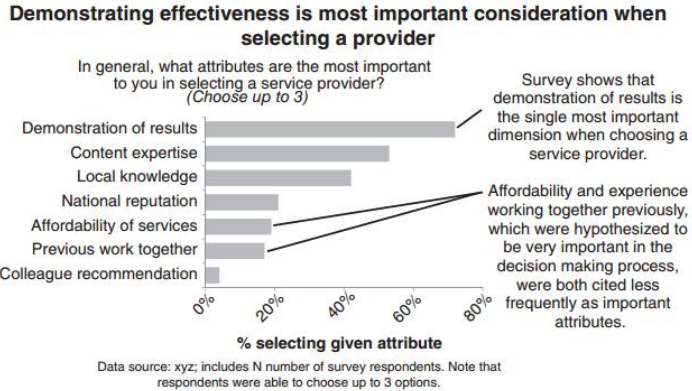

The chart shows the percent increase in confirmed cases from March 15 to 20. States with at least 50 cases on March 15 are shown.

Data Visualization Workflow: 3/6

Eliminate clutter

Clutter is visual elements that take up space but don't increase understanding.

Data Visualization Workflow: 4/6

Focus attention where you want it

- **Proximity** is that human tendency to think physically close object as belonging to the same group.
- **Similarity** means that, objects that are of similar colour, shape, size, or orientation are perceived as related or belonging to part of a group.
- **Enclosure**: we think of objects that are physically enclosed together as belonging to part of a group. Furthermore, humans like simplicity rather than complexity:
- **Continuity** is the human tendency to seek the most smooth path and even create one even if explicitly no such continuity exists.

similarity

continuity

closure

area

symmetry

Data Visualization Workflow: 5/6

Think like a designer .. and above all else show data.

Graphical elegance is often found in simplicity of design and complexity of data.

Data Visualization Workflow: 6/6

Tell a story

3-minute story: if you had only three minutes to tell your audience what they need to know, what would you say?’

Therefore it is important to understand the context and then embarking on your journey of utilizing the data as per the understood context.

Friendly vs Unfriendly Data Graphics

(Tufte. p183)

More Tips. Friendly Graphs

- Words are spelled out
- Words run from left to right
- Little messages help explain data
- Shadings, hatches and colors are avoided. - Labels are placed on graphics itself, so no legend is required
- Graphics attract viewers
- Colors are chosen so color blind can read them
- Type is clear and precise
- Type is upper and lowercase

More tips. Unfriendly Graphs

- Use of abbreviations
- Words run vertically, particularly along y-axis. Words run in different directions
- Graphic is cryptic and needs repeated references to scattered text
- Obscure codings need to go back to legend and graphic
- Chartjunk
- Design insensitive to color defunct
- Type is overbearing
- Type is all capitals

Common Mistakes

- Leaving gaps/changing the scale in vertical axes
- Uneven shading/colours
- Unfair emphasis on some sections
- Distorting areas in histograms (bar widths should always be equal)
- Use of 3-dimensions instead of two
- Misleading use of pictograms

Main Takeaways

- Simpler is most often better.
- More information is better than less information.
- Do not assume your audience is stupid.
- Tables usually outperform graphics in reporting on small data sets of 20 numbers or less.
- Graphical excellence is nearly always multivariate.
- Time-series is the most common graphical design.
- Data is plural for datum. Datum = 1 data point.
